Minrex Resources NL - ASX Release

12 April 2012

HIGHLIGHTS

- Minrex Resources NL has completed its preliminary auger and MAGLAG sampling survey at its Deflector Extended prospect located near Yalgoo, Western Australia.
- A total of 187 auger soil samples were collected on 400 m traverse lines, at intervals ranging from 100 m - 200 m.
- Sample analysis was undertaken by Ultratrace Geoanalytical Laboratories for a series of precious and base metals, including Au, Ag, As, Cu, Mo, Ni and W.
- Coincident MAGLAG samples were analysed using portable XRF (Niton) instrumentation.
- A series of follow-up targets have been identified.
- Minrex is continuing to explore for opportunities that will complement its existing exploration activities.

Overview

Deflector Extended Gold Project

The project area (E59/1657) was originally selected, based on its proximity to and alignment with, north-eastern extensions of the Deflector mineralisation trend (Figure 1). Aeromagnetic survey data confirms the presence of the Gearless Well intrusion which extends into the southern sections of the tenement. This granite exhibits a close spatial relationship with the Deflector and Golden Stream gold-copper deposits, which occur on the western contact of the intrusion and are coincident with a series of crosscutting northeast - southwest trending faults.

Current Exploration Program

Minrex Resources NL ('Minrex' or the 'Company') retained Pathfinder Exploration Pty Ltd (Pathfinder) to carry out an initial surface exploration geochemical program at its Deflector Extended Gold Project. This recently completed program, costing approximately $35,000, included collection of 187 auger soil and MAGLAG samples, from 10 traverses spaced 400 m apart with sample intervals between 100 m and 200 m apart, on east-west traverse lines (Figure 2). While drill access was reasonable, scrub and unfavourable topography restricted sampling across north-western and southern sections of the lease.

Depending upon ground conditions and prospective mineralisation, 2 kg auger samples were taken at an average of 1.7 m in depth. Where developed, base of calcrete samples were preferentially

collected, together with weathered saprolite or bedrock. ICP-OES analysis was completed on aqua regia digests for Au, Ag, As, Cu, Mo, Ni and W by Ultratrace Geoanalytical Laboratories (Appendix 1). Coincident MAGLAG samples were collected and analysed using a portable handheld (Niton) X-Ray Fluorescence spectrometer.

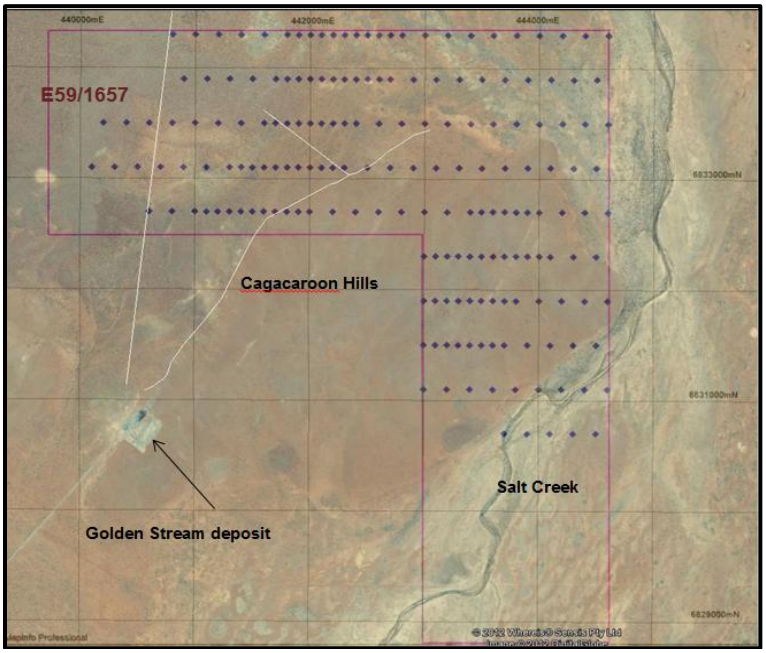

Figure 2: Deflector Extended Prospect - Auger + MAGLAG sample locations

Auger Soil Samples – Key Analytical Results

Gold

An irregular Au response was observed in the vicinity of the Deflector structural corridor in the northern sections of the lease, with samples peaking at 17 ppb Au in areas to its immediate west

MinRex Resources NL

(Figure 3). A larger halo appears downslope from the Cagacaroon Hills, comprising samples assaying up to 12 ppb Au, coincident with a central, northeast-southwest structural lineament. In southern tenement areas, a separate and diffuse Au trend with multiple 7 ppb Au assays was observed, broadly concurrent with a third northeast-southwest trending structure.

Copper

An elevated Cu signature is observed in the Deflector structural trend, with peak concentrations of 327 ppm defined. Extensive Cu dispersion is observed across both central and southern lineaments, whilst weaker in downslope areas from the Cagacaroon Hills (Figure 4).

Nickel

Ni assays exhibit a strong correlation with Cu and appear anomalous in the vicinity of the Deflector corridor, with peak concentrations of 628 ppm observed (Figure 5).

Planned Follow-up Activities

Auger soil / rock chip geochemistry and MAGLAG data have combined to define three Deflector Extended target areas (Figure 6), which coincide with northeast-southwest structures and appear amenable to sub-surface investigation using cost effective drilling techniques such as RAB +/- Aircore methods.

These areas include:

Target Area 1: Overlapping elevated auger Au, Cu and As values, supported by high MAGLAG Cu and As assays.

Target Area 2: Coincident Au and Cu enrichment, together with select elevated As assays.

Target Area 3: Coincident elevated auger Au and Cu values, together with spot As and Ni highs.

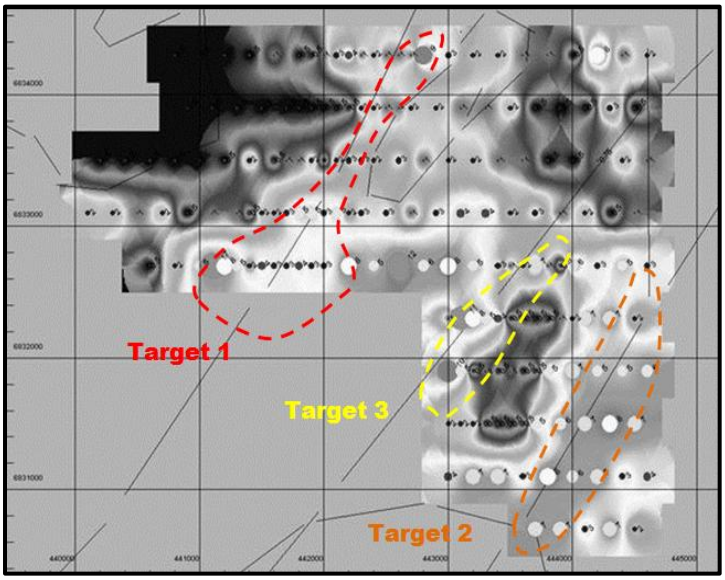

Figure 6: Deflector Extended - Prospective Follow-up Target Areas

Minrex will continue its systematic exploration activities at its Deflector Extended prospect to identify the source of enrichment observed to date, with a view to the intersection of economically significant precious and base metal mineralisation. These activities will be managed in conjunction with the Company's ongoing pursuit for new projects to complement the existing exploration activities.

About Minrex

Minrex has two principal projects. The Deflector Extended Gold Project is located within the Gullewa Greenstone Belt, south of Yalgoo in Western Australia. Mineralisation is exclusive to sulphidic or auriferous (coarse gold) quartz veining. Historical production commenced in the region in 1897 from the Daisy, Shannadoh, Gullewa Queen, Monarch, Phoenix, Victory United, Golden Stream, Mugga King and Mugga Queen Mines to the south west of the Deflector Extended Gold Project area. This historical production continued into the early 1940's. During this period a total of 35,726 ounces of gold was produced from a total of 24,000 tonnes of ore at an overall grade of 46.3 g/t Au. The Deflector Extended Gold Project has received cursory regional exploration including soil geochemistry surveys, rock chip sampling and RAB/AC drilling. Overlapping structural and soil geochemistry anomalies at Deflector Extended are the compelling exploration targets to be investigated by Minrex.

Within the Heemskirk Tin Project (EL 18/2011 already submitted for Ministerial approval) historical exploration is limited to non-systematic prospecting activities and has only focussed on surface mineralisation. The most substantial exploration efforts have focussed on the Peripatetic mine which consists of five adits, three shafts and numerous small open pits. Numerous historical workings within the project area present a number of opportunities to evaluate. Detailed mapping and geochemical sampling will be conducted across the prospect.

Competent Persons Statement:

The information in this announcement that relates to Exploration Results is based on information compiled by Dr. Geoffrey Booth, Consulting Geologist. Geoffrey Booth is employed as a consultant for Minrex and is also a Fellow of the Australasian Institute of Mining and Metallurgy and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Geoffrey Booth consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.
